Full Stack Software Engineer with deep expertise in distributed systems debugging, API integration, and internal tooling. Proven track record of reverse-engineering undocumented environments to unblock enterprise integrations and contributing production code to core Rails monoliths. Specialist in bridging the gap between Support and Engineering by building automated sanitation, observability, and data transformation pipelines using React, Node.js, TypeScript, and Python.

Professional Experience

Snapshot - Chicago, Illinois

Senior Technical Support Engineer | Jul 2025 – Present

- Production Feature Development (Ruby on Rails): Authored a production fix for Snapshot's SendGrid integration to enforce strict attachment size validation, preventing silent failures and "Payload Too Large" errors for high-volume customer communications.
- Initiated and implemented a Zendesk to LLM ticket summarization pipeline, including data export, transformation, attachment context extraction, and sequential/parallel processing optimizations.
- Incident Forensic Analysis: Led the root cause analysis for a distributed authentication outage (401 errors), identifying distinct failure modes across multiple tenant configurations that were previously misdiagnosed as a single systemic issue.
- Serve as the technical authority for API integration disputes, writing custom Node.js and Python scripts to reverse-engineer undocumented HMAC signatures and reproduce failure scenarios for enterprise clients (GEICO).
- Diagnosed CPU and memory saturation patterns across environments, recognizing OOM-killed workers and contributing to subsequent autoscaling and resource allocation improvements.

Technical Support Engineer | Jul 2024 – Jul 2025

- Built high-impact internal tools in Node.js used daily by Support and Engineering, including a JSON/PII sanitization tool that reduced payload preparation from *45 minutes to under 1 minute* and eliminated error-prone manual steps.
- Developed a Node.js attachment reconciliation script capable of validating thousands of document records in seconds, uncovering data mismatches missed by engineering and replacing a previously multi-day, unreliable manual task.
- Identified a systemic customer-facing rate-limit defect by analyzing New Relic request throughput grouped by tenant and correlating error timestamps, demonstrating clients were below documented thresholds during 429 responses; findings led engineering to discover rate limits were not scoped per-client.
- Designed and implemented the company's Opsgenie on-call automation, replacing ad-hoc/manual paging with a structured escalation chain (support → engineer → manager → director) and significantly improving after-hours responsiveness.

INSIGHT2PROFIT - Chicago, Illinois | Apr 2021 – Jul 2024

Application Developer

- Complex Business Logic: Implemented dynamic pricing algorithms for manufacturing clients, integrating real-time variable commodity costs (e.g., resin indices) into React-based visualizations to drive accurate financial decision-making.
- Full-Stack Bug Fixes: Owned the resolution of a critical timezone synchronization defect causing reporting errors for geographically distributed clients; standardized UTC/Local date handling across the stack to ensure data accuracy.
- Database & Feature Scaling: Enhanced a core "Mass Update" feature allowing users to modify large datasets in a single transaction; managed complex SQL migrations and optimized backend logic to ensure data integrity during bulk operations.
- Greenfield Development: Solely engineered a React/TypeScript "Decision Support" tool, translating opaque backend pricing criteria into an interactive UI that provided transparency into automated price generation.
- Developer Efficiency: Built custom templating tools adopted across three teams, standardizing project initialization and cutting setup time by 50%.

Technical Skills

- **Languages & Frameworks:** TypeScript, JavaScript (ES6+), Python, SQL, Java, C#, Node.js, React, Vite, Express
- **Tools & Cloud:** AWS (CloudWatch, API Gateway, SQS, DMS), Docker, Git, Postman, Jest, New Relic, Rollbar

Projects

Financial Data Reconciliation Tool | React, TypeScript, Vite

- Engineered a standalone application for a business client to diff complex CSV/JSON datasets; optimized O(n) lookup logic to reduce weekly workflow time from 25 hours to 4 hours.

Education

Tech Elevator | Cleveland, OH | *Certificate in Full Stack Java Development, 2021*

John Jay College (CUNY) | New York, NY | *Computer Science & Data Security*
